An Optimal Edge Coloring of Graphs Using a Given Set of Colors

Let $G$ be a graph with minimum degree $\delta(G)$. In any edge coloring of $G$ and any $v \in V(G)$, let $s(v)$ denote the number of different colors which appear on the edges incident with $v$. It was proved that if $\delta(G) > 1$, then $G$ has a $(\delta(G) - 1)$-edge-coloring (necessarily improper) in which all $\delta(G) - 1$ colors are represented at each vertex. We conjecture that if $G$ is a graph and $t$ is a positive integer, then the edges of $G$ can be colored using $t$ colors in which for each vertex $v$, $s(v) \geq \min(t, d(v) - 1)$. In this talk we show that the conjecture is true for $t \leq 3$. Also we show that if $G$ is a bipartite graph and $t$ is a positive integer, then all edges of $G$ can be colored using $t$ colors such that for each vertex $v$, $s(v) \geq \min(t, d(v))$.
