results

The power set function

- Consider Cantor's continuum hypothesis.
- It was introduced by Cantor in 1878.
- It asks: How many real numbers are there?
- Cantor Proved:

The power set function

- Consider Cantor's continuum hypothesis.
- It was introduced by Cantor in 1878.
- It asks: How many real numbers are there?
- Cantor Proved:
 - 1 $|\mathbb{R}| = 2^{\aleph_0}$,

The power set function

- Consider Cantor's continuum hypothesis.
- It was introduced by Cantor in 1878.
- It asks: How many real numbers are there?
- Cantor Proved:
 - 1 $|\mathbb{R}| = 2^{\aleph_0}$,
 - 2 $2^{\aleph_0} > \aleph_0$.

The power set function

- Consider Cantor's **continuum hypothesis**.
- It was introduced by Cantor in 1878.
- It asks: How many real numbers are there?
- Cantor Proved:
 - 1 $|\mathbb{R}| = 2^{\aleph_0}$,
 - 2 $2^{\aleph_0} > \aleph_0$.
- **CH** says there are no cardinals between \aleph_0 and 2^{\aleph_0} , i.e., $2^{\aleph_0} = \aleph_1$.

The power set function

- Consider Cantor's continuum hypothesis.
- It was introduced by Cantor in 1878.
- It asks: How many real numbers are there?
- Cantor Proved:
 - 1 $|\mathbb{R}| = 2^{\aleph_0}$,
 - 2 $2^{\aleph_0} > \aleph_0$.
- CH says there are no cardinals between \aleph_0 and 2^{\aleph_0} , i.e., $2^{\aleph_0} = \aleph_1$.
- The continuum problem appeared as the first problem in Hilbert's problem list in 1900.

results

The power set function

- There is no reason to restrict ourselves to \aleph_0 .
- Given any infinite cardinal κ , we can ask the same question for 2^κ .
- Then the **generalized Continuum hypothesis (GCH)** says that:

$$\forall \kappa, 2^\kappa = \kappa^+.$$

The power set function

- There is no reason to restrict ourselves to \aleph_0 .
- Given any infinite cardinal κ , we can ask the same question for 2^κ .
- Then the **generalized Continuum hypothesis (GCH)** says that:

$$\forall \kappa, 2^\kappa = \kappa^+.$$

- *GCH* first appeared in some works of Peirce, Hausdorff, Tarski and Sierpinski.

The power set function

- The power set (or the continuum) function is defined by

$$\kappa \mapsto 2^\kappa.$$

The power set function

- The power set (or the continuum) function is defined by

$$\kappa \mapsto 2^\kappa.$$

- The basic problem is to determine the behavior of the power function.

The power set function

Coding into a real

PCF theory:
getting *ZFC*
results

- The power set (or the continuum) function is defined by

$$\kappa \mapsto 2^\kappa.$$

- The basic problem is to determine the behavior of the power function.
- Some related questions are:
(**Continuum problem - Hilbert's first problem**): Is *CH*
(the assertion $2^{\aleph_0} = \aleph_1$) true?

The power set function

- The power set (or the continuum) function is defined by

$$\kappa \mapsto 2^\kappa.$$

- The basic problem is to determine the behavior of the power function.
- Some related questions are:
 - (**Continuum problem - Hilbert's first problem**): Is CH (the assertion: $2^{\aleph_0} = \aleph_1$) true?
 - (**Generalized continuum problem**): Is GCH (the assertion: for all infinite cardinals κ , $2^\kappa = \kappa^+$) true?

- The theory of **inner models** was introduced by **Godel**.

Consistency of GCH

- The theory of **inner models** was introduced by **Gödel**.
- He used the method to construct a model L of **$ZFC + GCH$** , thus showing that GCH is consistent with ZFC .

Recall that:

- $\kappa < \lambda \Rightarrow 2^\kappa \leq 2^\lambda$,
- $\forall \kappa, cf(2^\kappa) > \kappa$.

To prove his theorem, **Easton** created the theory of **class forcing**, where the poset is not necessarily a set.

Easton's theorem

Recall that:

- $\kappa < \lambda \Rightarrow 2^\kappa \leq 2^\lambda$,
- $\forall \kappa, cf(2^\kappa) > \kappa$.

The situation in this case is much more complicated, as it is not even clear if $V[G] \models ZFC$.

results

- In Easton type models, the power function on singular cardinals is determined easily:
- For κ singular, 2^κ is the least cardinal such that:
 - 1 $\forall \lambda < \kappa, 2^\lambda \leq 2^\kappa,$
 - 2 $cf(2^\kappa) > \kappa.$

Singular cardinals hypothesis (*SCH*)

- In Easton type models, the power function on singular cardinals is determined easily:
- For κ singular, 2^κ is the least cardinal such that:
 - 1 $\forall \lambda < \kappa, 2^\lambda \leq 2^\kappa,$
 - 2 $cf(2^\kappa) > \kappa.$
- Call this assumption: **singular cardinals hypothesis (*SCH*)**.

Singular cardinals hypothesis (*SCH*)

- In Easton type models, the power function on singular cardinals is determined easily:
- For κ singular, 2^κ is the least cardinal such that:
 - 1 $\forall \lambda < \kappa, 2^\lambda \leq 2^\kappa,$
 - 2 $cf(2^\kappa) > \kappa.$
- Call this assumption: **singular cardinals hypothesis (*SCH*)**.
- Thus if *SCH* were a theorem of *ZFC*, then the power function would be determined by knowing its behavior on all regular cardinals and the cofinality function.

- It follows that if \aleph_ω is a strong limit cardinal, then:

- It follows that if \aleph_ω is a strong limit cardinal, then:

$$2^{\aleph_\omega} < \aleph_{\omega_4}.$$

- It follows that if \aleph_ω is a strong limit cardinal, then:

$$2^{\aleph_\omega} < \aleph_{\omega_4}.$$

- (**Shelah's PCF conjecture**) If A is a progressive set of regular cardinals, then $|PCF(A)| \leq |A|$.

- It follows that if \aleph_ω is a strong limit cardinal, then:

$$2^{\aleph_\omega} < \aleph_{\omega_4}.$$

- (**Shelah's PCF conjecture**) If A is a progressive set of regular cardinals, then $|PCF(A)| \leq |A|$.
- The conjecture implies if \aleph_ω is a strong limit cardinal, then $2^{\aleph_\omega} < \aleph_{\omega_1}$.

- It follows that if \aleph_ω is a strong limit cardinal, then:

$$2^{\aleph_\omega} < \aleph_{\omega_4}.$$

- (Shelah's PCF conjecture) If A is a progressive set of regular cardinals, then $|PCF(A)| \leq |A|$.
- The conjecture implies if \aleph_ω is a strong limit cardinal, then $2^{\aleph_\omega} < \aleph_{\omega_1}$.
- So by previous results we will have a complete solution of the power function at \aleph_ω .
